OSMA FIREMAN

The ideal apparatus to dry inside Protective & Heavy-Duty Clothing

OSMA Fireman is the ideal apparatus to dry the inside of heavy-duty and water resistant protective clothing

The efficient drying process of the inside linings of protective clothing is very much appreciated by their users. This is because, due to the non-permeable qualities of today's modern materials, the user tends to sweat inside his jacket, trousers and overalls which not only leads to uncomfortable dampness but also to unpleasant odours.

The size and requirements of the apparatus is variable. The material is INOX stainless steel and therefore durable, easy to clean and therefore hygienic.

Just plug-in (230V) where you require it. It is also easily transported, is mobile and can be placed near to where the vehicles are parked – in case of emergency.
